

Database Management

- Create several projects according to your needs.
- Manage and control users and profiles.
- Create geological mapping code according the required detail.
- Customize your output data.
- Integrate changes easily.
- Access your data anywhere you are.
- Classifies your GIS information.
- Centralize all information projects on a unique database.
- Import and export data from and to varied sources.
- Ensures the security of your data and its traceability.

GVMapper is a software for geological data capture. Was designed to be adapted to any data capture environment, for mining production or exploration.

It can be used to create, modify and display surface maps, drillholes, underground maps and open pit maps, instantly validating the information captured by the geologist.

All the capture modules are integrated into a single database, allowing interaction of various dataset issued by different working groups in an easy and quickly way.
